GERMANIUM

A. Commodity Summary

Germanium is recovered either as a minor byproduct of the refining of base metal ores, or as a constituent of coal deposits. Germanium has a metallic grayish appearance and is hard and brittle. It is a semiconductor with electrical properties between those of metal and an insulator. The Bureau of Mines estimated domestic consumption at 25,000 kilograms during 1994. The domestic germanium industry is composed of three germanium refineries, one each in New York, Pennsylvania, and Oklahoma and a mining operation located in Tennessee. Additional information is provided on a recovery operation in Utah. Exhibit 1 presents the names and locations of the facilities involved in the production of germanium.

EXHIBIT 1
SUMMARY OF GERMANIUM PROCESSING FACILITIES

Facility Name	Location	Type of Operations
Atomergic Chem	Plainview, NY	Refining
Cabot	Revere, PA	Refining
Eagle-Picher	Quapaw, OK	Refining
Jersey Miniere	Clarksville, TN	Mining
Musto Exploration	St. George, UT	Mining and Refining
